## Nascom Documentation Library – PolyDos System Programmers Guide

```
1. Introduction
2. Polydos workspace
       2.1 System variables
       2.2 SCAL address table
       2.3 Information file area
       2.4 Sector buffer
       2.5 Directory buffer
       2.6 Overlay area
3. The Polydos file system
       3.1 Disk formats
       3.2 Files
                                   - File Name
              3.2.1 FNAM
              3.2.2 FEXT
                                   - File Extension
              3.2.3 FSFL
                                   - System Flags
              3.2.4 FUFL
                                   - User Flags
              3.2.5 FSEC
                                   - Sector Address
              3.2.6 FNSC
                                   - Length in Sectors
                                   - Load Address
              3.2.7 FLDA
              3.2.8 FEXA
                                   - Execute Address
       3.3 The disk directory
              3.3.1 DNAME
                                   - Disk Name
              3.3.2 NEXTSEC
                                   - Next free Sector Address
              3.3.3 NXTFCB
                                   - Next free FCB Address
       3.4 Allocating file and directory space
       3.4.1 Accessing the directory
4. System subroutines
       4.1 Polydos routines
              4.1.1 DSIZE
                                   - Returns disk size
              4.1.2 DRD
                                   - Read Sectors
```

4.1.3 DWR

- Write Sectors

```
4.1.12 CKBRK
                                   - Check for break entered on i/p devices
              4.1.13 CFMA
                                   - Abort command file mode
              4.1.14 SSCV
                                   - Set SCAL vector
              4.1.15 JUMP
                                   - Execute jump table
              4.1.16 POUT
                                   - Output A to printer
       4.2 Nas-Sys routines
              4.2.1 MRET
                                   - transfer control to Polydos Exec
              4.2.2 CRT
                                   - CRT routine modified to handle tab
              <u>4.2.3 NNIM</u>
                                   - keyboard routine has autorepeat function added
              4.2.4 BLINK
                                   - Blink routine modified to support command file mode
              4.2.5 RKBD
                                   - I/P from keyboard with repeat
                                   - Display two spaces
              4.2.6 SP2
              4.2.7 SCALI
                                   - SCAL indirect reg E contains subr number
5. Overlays
       5.1 File handler overlays
6 File formats
       6.1 Machine code program files
       6.2 Text files
       6.3 Overlay files
7. The command file mode
8. The information file
       8.1 Information file parameters
              8.1.1 Cursor characteristics
              8.1.2 Repeat keyboard delays
              8.1.3 printer forms parameters
              8.1.4 Printer initialisation
              8.1.5 Low level printer output routines
       8.2 A sample information file
Appendix A: SYSEQU listing
Appendix B: Polydos Controller ROM listing
Appendix C: Polydos Emsg overlay listing
```
